

Water Management Policy

Scope

Water is an essential resource for the preservation of natural ecosystems and the well-being of humanity. In alignment with sustainability principles and ESG criteria, our company is committed to safeguarding clean water resources for future generations by promoting the effective and efficient use of water. Our water management policy supports the United Nations Sustainable Development Goals, specifically SDG 6 (Clean Water and Sanitation) and SDG 12 (Responsible Consumption and Production), and aims to conserve water and protect water quality through innovative technologies and effective management strategies.

Our Principles

1. Legal Compliance and Accountability

- Ensure full compliance with national and international laws and regulatory requirements related to water management.
- Take proactive measures that go beyond compliance, anticipating future regulatory developments.
- Align operations with ISO 14001 Environmental Management and ISO 46001 Water Efficiency Management standards through site-specific certifications.
- Enhance water monitoring systems and ensure real-time tracking through digitalization.

2. Water Conservation and Efficiency

- Invest in advanced technologies to minimize water consumption and maximize efficiency.
- Continuously improve water performance, monitored through performance indicators.
- Promote water recycling and reuse through innovative solutions and process optimization.
- Explore alternative water sources, including the implementation of rainwater harvesting systems.
- Address regional water stress by developing action plans based on global water risk assessments, such as those by the World Wildlife Fund (WWF) and the World Resources Institute (WRI).

3. Protection of Water Quality

- Implement effective measures to safeguard water quality and mitigate potential impacts on water resources.
- Minimize water-related environmental impacts across the product life cycle.
- Employ innovative technologies to reduce operational impacts on local water systems.
- Conduct water footprint assessments in accordance with the ISO 14046 standard, ensuring accurate measurement and verification.

4. Stakeholder Engagement and Social Awareness

- Support initiatives that raise awareness about the environment and water use among stakeholders and the broader community.
- Strengthen cooperation with local communities, industry partners, and organizations on sustainable water management.
- Participate in both national and international water governance and stewardship initiatives.
- Undertake social responsibility projects in alignment with WASH (Water, Sanitation, and Hygiene) principles to improve access to clean water and sanitation.

5. Risk Management and Transparent Reporting

- Continuously enhance our capabilities in identifying, assessing, and managing water-related risks, with a focus on the water impacts of our operations and products.
- Report water-related data transparently on an annual basis in line with the CDP Water Security framework.
- Develop and regularly update the company's water strategy roadmap with continuous improvement.
